

WHERE OUR WOOD COMES FROM

Grown in New England. Harvested one tree at a time.

Every board in a Lundia closet comes from **single, hand-selected trees** harvested in the New England forests of **Merrimack and Hillsborough Counties**.

Sustainable harvesting means taking only what the forest can replace, so there is a steady supply of wood across the landscape and future growth is unaffected, or even improved. Our foresters work the way nature does, imitating natural disturbances to keep the forest in balance.

Single Tree Selection: A Light Touch

Instead of clearing land, foresters walk the woods and hand-select individual trees. Each tree is inspected for nests before it is cut, and any tree with heavy bird droppings ("white wash") around its base is left standing. It is the most responsible way to harvest, protecting both the forest and the wildlife that call it home.

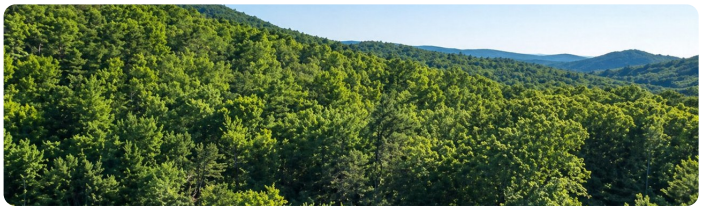

2–4 trees typically harvested per acre.
The rest of the forest is left to grow.

Why Single-Tree Harvesting Makes Healthier Forests

- **Stronger growth**
  Removing one tree frees up light, water and nutrients, so the trees around it grow more vigorously.
- **Healthy soil**
  Careful harvesting keeps soil quality and biological activity close to that of an unmanaged forest.
- **Greater diversity**
  Small openings in the canopy let young and old trees grow side by side, including sun-loving species.
- **A forest that still looks like a forest**
  Taking single trees leaves the landscape intact, with none of the scars of clear-cutting.
- **Richer wildlife habitat**
  Sunlight reaching the forest floor feeds shrubs and berries that give animals food and shelter.
